### **ABSTRACT**

The objective of present study is to compare the safety and efficacy of Antipsychotics in Schizophrenic patients by using Simpson Angus Score (SAS) and Positive and Negative Syndrome Score (PANSS).

**Method:** It is a Prospective, observational comparative multicentric study conducted in patients diagnosed with Schizophrenia in Warangal, Telangana state. The study protocol, Data collection sheet were submitted. A total of 513 patients were screened for the study prescribed with Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole.

**Statistical Analysis:** All the parameters were expressed as graphs and data analysis was performed using MS EXCEL and Graph pad prism 9.2.0 Version. Paired t test was computed for study variables.

**Results:** The results were confirmed by comparing the safety and efficacy of antipsychotics (Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole) by using PANSS and SAS scale. Efficacy in reducing Positive and Negative symptoms severity was slightly high in Lurasidone and Aripiprazole than compared to Olanzapine, Risperidone, Amisulpride. Safety of Lurasidone and Aripiprazole was slightly more compared to Olanzapine, Risperidone and Amisulpride.

**Keywords:** Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole, Schizophrenia.

### **1. INTRODUCTION**

Schizophrenia is a Psychotic illness. Psychosis is a syndrome in which person's mental capacity, affective response, and capacity to recognize reality, communicate, and relate to others is impaired, Schizophrenia can erupt suddenly when a patient decompensates into a psychotic episode [1]. Schizophrenia is characterized by group of symptoms. It includes Positive and Negative symptomsAccording to American psychiatric association second generation antipsychotics are the agents of choice for the first line treatment of Schizophrenia<sup>[2,3]</sup>.

### **2. MATERIAL AND METHODS**

A prospective, observational, multicentric study was conducted on 513 schizophrenia patients receiving antipsychotic treatment at MGM Hospital, Jaya Krishna Hospital, Manisha Neuropsychiatry Clinic, and Samlochana Swastik Hospital in Warangal. Ethical approval was obtained, and informed consent was collected in the patients' native language.

Efficacy was assessed using the Positive and Negative Syndrome Scale (PANSS), and safety was evaluated using the Simpson-Angus Scale (SAS). The antipsychotics studied included Risperidone, Olanzapine, Amisulpride, Lurasidone, and Aripiprazole.Statistical analysis was conducted using MS Excel and GraphPad Prism 9.2.0. Paired t-tests were applied to

compare safety and efficacy parameters between the first and second visits, with results expressed as Mean  $\pm$  Standard Deviation (SD).

### 3. RESULTS

The total study was carried with 513 patients who were diagnosed with Schizophrenia who were on treatment with Antipsychotics. A total of 513 case files were enrolled in this prospective observational comparative multicentric study conducted in MGM Hospital, Jayakrishna Hospital, Samlochanaswastik Hospital, Manisha Neuropsychiatry Clinic, Warangal, Telangana.

### 4. STATISTICAL ANALYSIS

Statistical analysis was done including both 1<sup>st</sup> visit and 2<sup>nd</sup> visit. For the safety and efficacy criteria, a paired t- test was carried out for the quantitative variables.

### 5. SAFETY

In Schizophrenia patients Extra Pyramidal Symptoms were assessed by Simpson Angus Scale.

**Figure 1: SAS Comparison of (Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole)**

SAS parameters showed a slight increase at visit 2 in the Risperidone, Olanzapine, and Amisulpride groups. In the Lurasidone group, most parameters (D, SH, ER, WR, HR, SV, A) showed a marked decrease, while GT, T, and G were mildly present. In the Aripiprazole group, only mild occurrences of G, AD, SH, ER, and WR were noted, with GT, T, SV, and AD not observed.

## 6. EFFICACY

The Efficacy of Schizophrenic patients was assessed by Positive and Negative Syndrome Scale which includes positive scale, negative scale, and General Psychopathological scale.

**Figure 2: PANSS Positive Comparison of Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole**

PANSS positive symptoms decreased across all groups from visit 1 to 2. Risperidone showed significant improvement in DL, CD, HB, EX, SP, HO, and mild reduction in GR. Olanzapine showed slight decreases in most symptoms, with notable reductions in SP (-1.980) and HO (-1.158). Amisulpride showed mild improvements, except no change in EX and moderate decrease in GR. Lurasidone and Aripiprazole showed the greatest overall reduction in all positive symptoms, indicating superior efficacy.

**Figure 3: Comparision of PANSS Negative parameters of Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole**

PANSS positive symptoms decreased in all groups. Risperidone and Olanzapine showed moderate improvements, with Olanzapine notably reducing SP and HO. Amisulpride showed mild changes, with no effect on EX. Lurasidone and Aripiprazole showed the most significant overall improvement, indicating higher efficacy.

**Figure 4: Comparision of PANSS General psychopathologic parameters in Risperidone, Olanzapine, Amisulpride, Lurasidone and Aripiprazole.**

PANSS general psychopathology symptoms showed mild to moderate reductions with Risperidone, Olanzapine, and Amisulpride, with Olanzapine showing no change in SC and AX. Lurasidone and Aripiprazole showed significant overall improvement, indicating superior efficacy in reducing general psychopathology symptoms by visit 2.

## 7. DISCUSSION

This study compared the Safety and Efficacy of five Antipsychotics—Risperidone, Olanzapine, Amisulpride, Lurasidone, and Aripiprazole in 513 schizophrenia patients. Safety was assessed using the Simpson Angus Scale (SAS), and efficacy using the Positive and Negative Syndrome Scale (PANSS). Among safety outcomes, extrapyramidal symptoms (EPS) such as gait issues, rigidity, and akathisia were more frequently observed in Risperidone, Olanzapine, and Amisulpride groups, whereas Lurasidone and Aripiprazole reported fewer and milder EPS.

In terms of efficacy for positive symptoms, Aripiprazole and Lurasidone showed greater reduction, particularly in delusions, hallucinations, and hostility, compared to the other three drugs. Olanzapine showed moderate improvement, while Risperidone and Amisulpride demonstrated mild to moderate efficacy. For negative symptoms, Lurasidone and Aripiprazole

again showed higher symptom reduction, whereas Olanzapine showed moderate improvement, and Risperidone and Amisulpride showed mild effects.

General Psychopathology symptoms were significantly improved with Lurasidone and moderately improved with Aripiprazole. Risperidone, Olanzapine, and Amisulpride showed only mild improvements in most parameters.

Supporting literature aligns with these findings: Lurasidone and Aripiprazole were consistently reported as effective and well-tolerated. Previous studies (e.g., Higuchi et al., Citrome et al., Meltzer et al.) support the superior efficacy and safety profile of Lurasidone. Aripiprazole has also been found effective in reducing both positive and negative symptoms with fewer side effects, as noted by Potkin et al. and Jindal et al<sup>(5,6,7,8,9)</sup>.

## 8. CONCLUSION

In conclusion, the data obtained from the current study suggests that all the Antipsychotics (Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole) were effective in treating the symptom severity of schizophrenia and they can induce extrapyramidal symptoms, but their extent of inducing extrapyramidal symptoms varies from moderate to mild for Risperidone, Olanzapine, Amisulpride, and very mild for Lurasidone and Aripiprazole. The results were confirmed by comparing the safety and efficacy of Antipsychotics (Risperidone, Olanzapine, Amisulpride, Lurasidone, Aripiprazole) by using PANSS and SAS scale. Efficacy in reducing Positive and Negative symptoms severity was slightly high in Lurasidone and Aripiprazole than compared to Olanzapine, Risperidone, Amisulpride. Safety of Lurasidone and Aripiprazole was slightly more compared to Olanzapine, Risperidone and Amisulpride.
